Count-less
Benefits

www.irys.com.sg

irys Pte. Ltd. is a pioneer of jewellery management solutions based on next generation auto-identification technologies.

irys's Inventory Management System uses state-of-the-art RFID technology to create and track multiple physical pieces accurately and efficiently – so you achieve tighter monitoring of these high value items. By adding the new line-up of products, irys has managed to provide the smartest solutions to some of the most complex processes in the jewellery industry.

IRYS IS:

Efficient Inventory Management | Enhanced Shopping Experience | Business Analytics

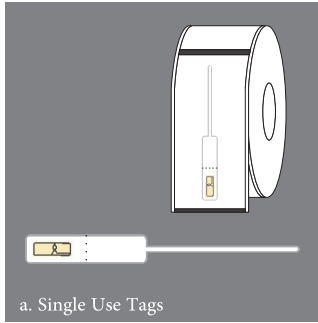

Key Features

- Automated Stock Taking
- 100% Accurate
- Tracks 100 items per second
- Portability for On-the-Go Operations
- User Friendly & Maintenance Free
- Saves valuable time & Dependency

Tag

RFID tags/chips are the simplest and easiest way to give your jewellery business a technological edge. You can fully automate many processes and make your overall functioning faster, smoother and more efficient.

a. Single Use Tags

These tags are used when fast encoding of tags is a priority. A single click can encode dozens of RFID tags (via the RFID printer) in a minute thereby saving valuable time. Another advantage of single use tags is that the barcode is directly printed on the tag, reducing redundancy in any processes.

b. Re-Usable Tags

These tags are used when smaller quantities of jewellery items are involved. The time taken to encode the tags is more, but as the name suggests, these tags are re-usable. Hence after a particular item has been sold, the tag can be removed from in-between the barcode label and re-encoded for use with any other item.

RFID & Barcode Printer

This device is useful when a large number of tags need to be encoded. Using an RFID printer for printing/encoding tags saves considerable amount of time and efforts. It directly encodes the RFID tag and prints barcodes at the same time.

This device scans a stack of jewellery trays instantaneously, which makes the process of counting faster and more foolproof. A large jewellery store or a warehouse is the most likely candidate for the Pandora. Trays of tagged jewellery items can simply be passed through the scan area and moved on to the strong room. The results are instantly presented and verified on the computer screen.

Tally upto 100 items / second

Tally becomes a hassle-free and foolproof process with the help of devices like Pandora, portable scanners and handheld terminals. It also saves hours of labour time.

This is an ultra-portable device which communicates via bluetooth and needs a host (PC, mobile phone or PDA) to communicate with. Once the devices are paired, the scanner automatically detects tagged jewellery items and transfers the data to the host. This device also helps with item search.

This is a Wi-Fi enabled mobile computer with an integrated RFID scanner, which automatically detects tagged jewellery items directly from the display. Eliminating the need for a host, this scanner simply needs to be moved over trays of jewellery & the count will be instantly displayed on its screen.

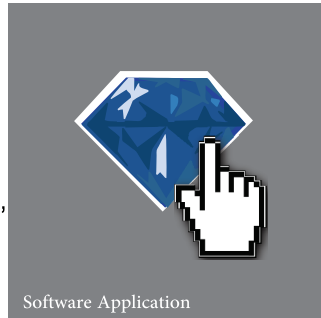

Talk

Talk to your customers & employees using modern technology. While the software organizes & tells your employees about products & buying trends, the Smart Tray gives your customers a novel browsing experience.

Smart Tray

This is a portable device which enhances customer experience while shopping for jewellery. An RFID tray, coupled with a tablet empowers the customer to view & compare specific details about a jewellery piece. It also helps the jeweller collect valuable business intelligence regarding customer behavior and certain trends in buying.

Software Application

In addition to customer interaction, the IRYS software application is also designed to offer seamless integration of all devices being used by the store through a simple & easy to use interface.
